- IT Equipment Configuration
- Facility Audits
- IT System Growth Modeling
- Hardware, Electrical Load Analysis
- Site Selection and Evaluation
- Value Engineering
- Cable Plant Layout/Design
- Cabling and Electrical services

24-hour, 7 Day-A-Week Support

Pinnacle is committed to providing you with total data center design solutions from redesigning or upgrading your current data center environment to building a new one. We are experienced and capable in helping you develop a solid plan that will meet your business and technology needs.

Our experienced designers and project managers listen to your business objectives and requirements and build your data center to ensure your information technology needs are met. We ask you how much space is needed, who will have access to what, how the facility will grow in the years to come. Recommendations are then made for the most effective technology you can use to build your information technology infrastructure.

We provide you with the matrix to quantify the relationship and the critical functions. Diagrams showing these relationships and a series of preliminary floor plans and sketches are then submitted to you for approval.

After the layout is finalized and approved, we engineer the infrastructure and determine the requirements of your facility. We then develop a plan indicating various required elements. Our team of experts is capable of building your data center per design approved by your team.

***I** looked for a vendor/consultant who had the ability to integrate with my client's IT staff and compliment their group! Pinnacle's team is "proactive" in lieu of "reactive" and is knowledgeable in terms of new trends!*
